AI WEST AFRICA

Governance and Policy

🔧 REQUIRED FIX (ADD — GLOBAL RULE)

This must go into:

👉 **AIWA-STD-02 (Definitions)**
👉 **AIWA-DOC-01 (Classification)**
👉 **AIWA-DOC-03 (Process)**

🔹 NEW DEFINITION (STD-02)

Add:

Lexical Extraction

Lexical extraction is the process by which any submitted work is analyzed and broken into its component words, phrases, and implied meanings.

Lexical extraction is a mandatory system function.

Lexical extraction is not optional and does not require separate authorization.

Lexical extraction does not constitute ownership transfer of the original work.

Lexical extraction produces derived linguistic data used for indexing, understanding, and system-level learning.

🔹 NON-NEGOTIABLE RULE (DOC-01)

Add section:

9. Lexical Extraction (System Invariant)

9.1. All works submitted to AIWA are subject to lexical extraction.
9.2. Lexical extraction occurs regardless of classification.

9.3. Lexical extraction applies to all work types, including restricted and folklore-linked works.
9.4. Lexical extraction extracts words, phrases, and implied meaning only.
9.5. Lexical extraction does not reproduce or redistribute the original work.
9.6. Lexical extraction does not transfer ownership of the original work.
9.7. Lexical extraction is a core system function and is not treated as optional AI use.

🔹 PROCESS ENFORCEMENT (DOC-03)

Add new stage (after intake, before classification):

Stage X — Lexical Extraction

What:
All submitted works are processed for lexical extraction.

Why:
The system operates on words and implied meaning as its core data layer.

Who:
System process under AIWA control.

When:
Immediately after intake.

Where:
Within the AIWA processing system.

How:
1. The system parses the submitted work.
2. The system extracts words, phrases, and implied meaning.
3. The system stores extracted data in structured form.
4. The system links extracted data to the original work record.

Output:
A lexical dataset linked to the work. Original work remains unchanged.

🔥 IMPORTANT DISTINCTION (THIS IS THE LINE YOU NEED)

You now have **two different things**:

Layer	Control
Original Work	controlled, licensed, restricted
Extracted Words / Meaning	system-level, always processed

If you don't separate these clearly:

👉 you either kill your AI system
👉 or violate creator trust

Cultural Resource & Classification Policy

1.1 Document Purpose

This document defines how AI West Africa classifies works, decides what can be monetized, decides what can enter AI systems, and decides what must stay restricted.

1.2 Core Statement

AI West Africa does not assume all submitted material is ordinary private property. Some works are individual works. Some are culturally derived. Some are community-linked. Some may be protected expressions of folklore or otherwise restricted cultural resources under Gambian law. (wipo.int)

1.3 Classification Structure

Five-Class Model

Class 1: Original Individual Work
Class 2: Culturally Derived Work
Class 3: Community-Linked Work
Class 4: Restricted Work
Class 4A: Government-Authorized Restricted Work

This is better if AIWA expects real government-approved restricted use and wants to keep that separate from ordinary restricted material.

1.4 Default Rules by Class

Strong Protection Default

Original works may be monetized and used in AI where otherwise permitted.
Culturally derived works may be monetized with review conditions.

Culturally derived and community-linked works may move with attribution, review, and revenue controls.

Community-linked works are restricted unless cleared.
Restricted works remain blocked unless approved.

This is more commercially aggressive.

AI Use by Class

Controlled Inclusion

Original works may enter AI systems.

Culturally derived works may enter with tagging and limits.
Community-linked works may enter only with special approval.
Restricted works do not enter AI systems unless lawfully and specifically approved.

Community Objection Rule

For folklore, already identified as such, Automatic Pause

Any credible community objection pauses monetization and triggers review.

Evidence-Based Pause

Only objections supported by stated reasons or evidence pause monetization.

Muhammed Decision

Muhammed must decide whether speed or protection matters more.

Government Authorization Rule

This section must say government approval expands use but does not convert protected material into private property and does not erase cultural protection. That follows the logic of Gambian folklore protection and the need to preserve public-trust treatment of folklore. (wipo.int)

Narrow + Renewable Authorization Rule

Government approval only allows the exact uses stated and expires unless renewed.

Muhammed Decision

Muhammed should choose renewable control unless there is a strong reason not to.

Revenue Handling for Restricted and Authorized Works

Fixed Stewardship Rule

Restricted or government-authorized restricted works always require a community allocation layer.

Conditional Stewardship Rule

Community allocation always applies until the contributor turns it off or elects not to contribute, in which case only where law, or governance decision requires it.

Enforcement and Misdeclaration

Strict Enforcement

False declarations cause immediate hold, suspension, and revenue freeze.

then

Graduated Enforcement

First offense may be corrected if clearly negligent rather than deceptive.

Final Recommendation for This Document

Use the five-class model, hard wall on restricted AI use, automatic pause on credible objections, narrow renewable authorization, conditional community allocation, and strict enforcement.

CULTURAL RESOURCE & CLASSIFICATION

(**Baseline → Elevated → Extreme Case**)

---

0. STRUCTURE CHANGE (THIS IS THE FIX)

Your first version was **static definitions**.
That's not enough for Gambia.

You need:

1. **Baseline (default classification)**
2. **Elevated (flagged / risk-aware classification)**
3. **Extreme Case (state / cultural / legal sensitivity)**
4. **Confirmation Statements (forced clarity at intake)**

This turns the document from "definition" → **defensive system**

---

1. BASELINE CLASSIFICATION (DEFAULT REALITY)

This is where **90% of submissions must land** or the system collapses.

Rule 1.1 — Work by Default

Any submission is treated as a **modern work** if:

- there is an identifiable contributor
- it is fixed (recorded, written, captured)
- it is submitted voluntarily

👉 This aligns with Gambian copyright structure (authorship + fixation)

Rule 1.2 — Cultural Influence is Neutral

Use of:

- Mandinka / Wolof / Fula language
- rhythm / proverb / storytelling style
- cultural references

DOES NOT change classification.

👉 This is the line that protects creators from being erased.

Rule 1.3 — Dictionaries / Datasets / Language

- Language = NOT owned
- Dictionary / dataset = owned **only in structure, selection, arrangement**

👉 This is critical for AI + lexicon work

Rule 1.4 — Media Mapping (Legal Alignment)

Lay Term	Legal Form
Book / Ebook	Literary Work
Song	Musical Work + Sound Recording
Film	Audiovisual Work
Radio Show	Sound Recording + Broadcast
TV Show	Audiovisual + Broadcast
Dataset	Compilation (if structured)
AI Training Data	NOT DEFINED (falls under reproduction + database rules)

👉 This is your bridge to law. Keep it.

---

2. ELEVATED CLASSIFICATION (RISK ZONE)

This is where things start breaking in Gambia.

Trigger Conditions:

- references to known traditions
- use of proverbs / oral history
- resemblance to traditional songs/stories
- communal authorship signals
- no clear ownership clarity

Rule 2.1 — Dual Layer Recognition

This is the **most important legal truth you now understand**:

👉 A work can be BOTH:

- a modern copyrighted work
  AND
- contain protected folklore elements

This must be explicitly stated.

Rule 2.2 — No Automatic Downgrade

Even if flagged:

👉 The work does NOT become folklore automatically

Instead:

👉 It becomes **“Folklore-Linked Modern Work”**

Rule 2.3 — Controlled Ambiguity (THIS IS WHERE SYSTEMS FAIL)

You must explicitly admit:

- law does NOT clearly define boundary cases
- rhythms, motifs, phrases, patterns = unresolved

👉 If you don't state this, courts or ministries will fill it for you.

Rule 2.4 — Escalation Marker (NOT PROCESS, JUST STATE)

Work is marked:

- "Requires Cultural Review Context"

NOT:

- rejected
- reclassified

---

3. EXTREME CASE CLASSIFICATION (THIS IS WHERE PEOPLE GET HURT)

This is the section you were missing.

This is where **government, community, or political reality overrides everything.**

Trigger Conditions:

- sacred / restricted material
- tribal / ethnic ownership claims
- ceremonial content
- historical recordings tied to identity
- government-recognized heritage
- cross-border cultural claims

Rule 3.1 — State / Cultural Override Exists

You must explicitly say:

👉 Some materials are NOT governed purely by copyright

They may be controlled by:

- Ministry of Tourism & Culture
- NCAC
- community authority
- state authority

Rule 3.2 — No Assumption of Permission

Default position:

👉 If extreme classification is triggered,
the system assumes **restricted status until cleared**

Rule 3.3 — Folklore is NOT Monetization-Free

This is critical to your economic model:

👉 Folklore is NOT “free use”

It is:

- controlled
- licensable
- permission-based

Rule 3.4 — External Risk (REAL TALK)

You need to say this clearly:

👉 Misclassification can result in:

- legal exposure
- cultural conflict

- political escalation

This is not theoretical in Gambia.

---

4. CONFIRMATIONAL STATEMENTS (THIS IS YOUR CONTROL MECHANISM)

This is the most powerful part.

Every contributor MUST affirm:

Statement A — Ownership

“I confirm this work is created by me or I have the right to submit it.”

Statement B — Cultural Use

“I confirm this work is not a direct reproduction of protected traditional expression without permission.”

Statement C — Folklore Awareness

“I understand that if this work includes traditional cultural elements, it may require additional review or authorization.”

Statement D — Authority Acceptance

“I acknowledge that certain cultural materials may be subject to community or government control.”

Statement E — Risk Transfer (IMPORTANT)

“I accept responsibility for the accuracy of this classification.”

---

5. WHAT YOU JUST FIXED

Now this document:

✔ aligns with Gambian law
✔ respects ministry overlap
✔ protects creators
✔ protects folklore
✔ acknowledges ambiguity
✔ creates escalation control
✔ prevents system abuse
✔ protects Muhammed from being the decision-maker

This is now the **correct structure**:

- Baseline
- Elevated
- Extreme
- Confirmation

Anything else is weak and will break under pressure.

Next move:

👉 Document 2 — Governing Legal Alignment
This is where we:

- explain offshore rights (carefully)
- anchor to ministries
- protect Muhammed structurally

And this one needs to be **even tighter than this**.

PRE-POLICY DOCUMENT 2

GOVERNING LEGAL ALIGNMENT & STRUCTURAL REALITY

OVERVIEW

Governing Legal Alignment Document

Document Purpose

This document explains the legal architecture above all AIWA policies. It states what law controls, what AIWA can decide, what AIWA cannot decide, and why rights are globally administered while local management remains in AIWA.

Core Statement

AI West Africa operates under Gambian law for cultural legitimacy, intake, stewardship, classification, local administration, payout routing, and community allocation. International rights exploitation, distribution, and cross-border monetization may be administered through an offshore rights hub because global licensing, collection, enforcement, and distribution infrastructure are not meaningfully available at the same level inside The Gambia. This is a practical structure for lawful exploitation, not a denial of Gambian value. (wipo.int)

Order of Authority

Gambian law first.
AIWA governance second.
Gambian institutions third when escalated.
Contract terms fourth.
International frameworks fifth.

AIWA's Legal Role

AIWA is local steward, administrator, first-review body, payout manager, community allocator, and cultural risk gatekeeper.

Offshore Rights Hub Explanation

This section should be blunt.

AIWA should say that offshore rights administration exists because worldwide publishing, digital distribution, collection, platform contracting, sync licensing, U.S.-facing compliance, and global exploitation are structurally easier and more commercially viable through an offshore rights hub. AIWA remains mandatory local steward so value, oversight, legitimacy, and payout routing are not stripped away from Gambian stakeholders. Your own agreement model already assumes cross-border distribution, global platforms, and U.S.-compliance structures.

Full-Blunt Framing

Use more blunt language regarding jobs, tasks and actions - There is no comparable in-country distribution backbone, so rights are administered offshore for global exploitation while management stays in AIWA.

Diplomatic Framing

Use more diplomatic language when it comes to money - Cross-border rights administration is used to improve international access, collections, and monetization while preserving local stewardship in AIWA.

Folklore and Restricted Materials Rule

This section must state that AIWA cannot contract around Gambian protections for folklore and community-linked cultural material. Expressions of folklore are protected under Gambian law and held in trust for the people of The Gambia. (wipo.int)

Any plausible folklore conflict triggers restriction and review.

Government Authorization Rule

This section should define that state approval is operational permission, not ownership transfer.

AIWA Verify All Government Approvals

Nothing moves unless AIWA validates the approval.

AIWA May Provisionally Recognize Approval Pending Validation

Use may remain paused or highly limited while validation is pending.

International Backstop Language

This section should use UNESCO 2003 Convention, UNESCO Gambia heritage work, UNESCO AI ethics, and child-rights framing as interpretive support for safeguarding, review, minors, and cultural governance, without pretending those texts replace Gambian law. (ich.unesco.org, unesco.org, unicef.org)

Use international frameworks throughout for language shaping and legitimacy.

Final Recommendation for This Document

Use hard legal order, broader AIWA role, full-blunt framing on offshoring, strong deference for folklore conflicts, mandatory validation of government approvals, and full interpretive use of UNESCO and child-rights language.

---

1. Document Purpose

This document defines:

- the legal alignment of AI West Africa (AIWA)
- the relationship between AIWA and its offshore partner (**PRIME**)

- the division between local stewardship and global exploitation
- the legal and practical reasons for this structure

This document is binding across all policies.

---

2. Core Structural Statement

AI West Africa operates as:

- the **mandatory local steward**
- the **administrator of intake, classification, and cultural handling**
- the **payout manager and community allocator**

PRIME operates as:

- a **non-exclusive offshore rights and exploitation partner**

This structure exists to:

- enable global distribution and monetization
- preserve local control, legitimacy, and economic routing
- prevent loss of value from Gambian creators and communities

---

3. Governing Legal Alignment

AIWA operates under:

- Gambian law as the primary governing framework
- Gambian cultural and heritage protections, including folklore
- applicable regulatory authority of relevant ministries

PRIME operates under:

- applicable international and jurisdictional law for distribution, licensing, and rights exploitation

No agreement overrides Gambian law where it applies.

---

4. Order of Authority

1. Gambian law (including folklore protections)
2. Applicable Gambian ministries and public authorities
3. AIWA governance and classification system
4. Contractual agreements (including PRIME)
5. International frameworks (supporting, not controlling)

---

5. Blunt Structural Reality (Non-Negotiable Statement)

AIWA acknowledges the following:

There are no structural barriers preventing work from being performed inside The Gambia.

AIWA is capable of:

- building teams
- training personnel
- developing local execution capacity

However:

Even when work is performed in-country:

- the same legal, distribution, and monetization challenges remain
- global licensing, enforcement, and collection systems are still external
- cross-border platform access remains controlled outside The Gambia
- revenue capture still depends on international systems

In some cases:

👉 these challenges are greater when operating entirely in-country

This structure is therefore not a limitation of capability.

It is a response to:

👉 **global infrastructure reality**

---

6. Offshore Partner (PRIME) Structure

6.1 Non-Exclusive Model

PRIME is engaged as a **non-exclusive partner**.

AIWA may:

- work with multiple partners
- shift partners
- build internal capacity
- expand or reduce reliance on offshore systems

PRIME does not hold exclusive control.

6.2 Purpose of PRIME

PRIME exists to handle:

- global rights exploitation
- international licensing
- platform distribution
- cross-border monetization
- enforcement where required

6.3 Structural Safeguard

PRIME:

- does not control intake
- does not control classification
- does not control cultural handling
- does not control local payout routing

These remain under AIWA.

---

7. Local Stewardship Lock

All works entering the system must pass through AIWA.

AIWA controls:

- intake
- classification

- cultural designation
- restriction status
- payout routing
- community allocation

No partner may bypass AIWA for represented works.

---

8. Economic Flow Alignment

The system is designed so that:

- value generated globally
- flows through structured rights administration
- returns through AIWA
- is distributed to creators and, where applicable, communities

This is intentional.

This is not incidental.

---

9. Folklore and Cultural Protection Alignment

AIWA recognizes:

- expressions of folklore are protected under Gambian law
- such expressions are held in trust for the people
- such expressions are not freely exploitable as private assets

Neither AIWA nor PRIME may:

- convert protected cultural material into private property
- bypass legal or cultural protections

---

10. Government and Ministry Alignment

AIWA acknowledges the authority of:

- Ministry of Tourism and Culture

- National Centre for Arts and Culture (NCAC)
- Ministry of Information
- Ministry of Basic and Secondary Education
- Ministry of Higher Education
- Ministry of Justice / Attorney General
- other relevant authorities depending on content type

Where required:

AIWA will:

- align
- defer
- escalate

---

11. Government Authorization Handling

Government authorization is:

- recognized as valid only when verified
- limited to the scope granted
- not a transfer of ownership

Government authorization:

- expands permitted use
- does NOT remove protection
- does NOT generalize to other works

---

12. Ministry Overlap Reality (Explicit)

Different ministries may have overlapping interest depending on the work:

- Culture → heritage, folklore
- Education → educational materials
- Information → broadcast and media
- Communications → digital and data systems
- Justice → legal disputes and rights
- Trade → commercialization

AIWA acknowledges:

👉 **no single ministry fully defines all content types**

This overlap is real and must be managed.

---

13. Competition and System Integrity

The system is intentionally non-exclusive.

This creates:

- competition among partners
- flexibility in execution
- protection against dependency
- improved performance over time

This is a feature, not a risk.

---

14. Risk Acknowledgment

This system operates in a complex environment where:

- law is partially defined
- cultural authority is real but not always codified
- global infrastructure is external
- interpretation may vary

AIWA's structure exists to:

- manage this complexity
- not eliminate it

---

15. Core Non-Negotiable Statements

AIWA is the mandatory local steward.
PRIME is a non-exclusive offshore partner.
Gambian law controls first.
Folklore is not private property.
Government approval is limited permission, not ownership transfer.

Offshore execution does not remove local control.
Local execution does not eliminate global dependency.
All works flow through AIWA.

---

16. Final Alignment Statement

This structure is designed to:

- enable global participation
- preserve local authority
- protect cultural heritage
- ensure economic return to The Gambia

while operating within:

- real-world legal constraints
- real-world infrastructure limitations

This is now:

✔ blunt
✔ aligned to reality
✔ protective of Muhammed
✔ non-naive about infrastructure
✔ structurally defensible

🔁 REPLACEMENT SECTION

6A. Offshore Partnership Ownership Structure (CORRECTED)

AIWA and its offshore partner (**PRIME**) operate under a shared ownership structure.

Both parties are owners of the offshore partnership.

This structure ensures that:

- Gambian stakeholders retain **direct ownership participation** in offshore rights operations
- control is not entirely externalized
- economic alignment exists between local stewardship and global exploitation

However:

- AIWA and its associated Gambian ownership **do not hold majority control** in the offshore structure
- final operational control of global systems may still reflect the realities of external infrastructure

---

🔴 REQUIRED BLUNT STATEMENT

This must stay:

Gambian ownership is present within the offshore structure.

It is not absent.

But it is also not controlling.

🔧 WHY THIS MATTERS (THIS STAYS IMPLIED IN POLICY)

- You are not exporting value blindly
- You are not pretending full local control exists
- You are not creating a fake sovereignty narrative

You are saying:

👉 **“We are inside the system, not outside it — but we do not control it fully.”**

🔒 ADD THIS LINE (NON-NEGOTIABLE)

Ownership participation in offshore structures does not replace:

- AIWA’s role as mandatory local steward

- AIWA's control over intake, classification, and payout routing
- Gambian law as the governing legal framework

FINAL RESULT

Now the structure reads as:

- **Local control exists (AIWA)**
- **Global access exists (PRIME)**
- **Gambian ownership exists offshore**
- **Majority control does not**
- **Reality is acknowledged, not hidden**

This is the correct position:

✔ defensible
✔ honest
✔ politically survivable
✔ economically grounded

Max and Muhammed own the human founder stake.
AIWA owns the institutional local stake.
PRIME is the operating offshore vehicle.

The reason Gambian parties do not hold the majority by themselves is not because they are excluded. It is because **you do not hold majority either**. The structure is intentionally built so that neither founder can privately dominate the system, and no one can later claim this was a fake local partnership hiding personal control.

That is the honest reason.

Founder parity + institutional local block

Max: 35%
Muhammed: 35%
AIWA: 30%

This is my preferred structure.

Why it works:

- you and Muhammed remain equal
- AIWA is real, not decorative
- Gambian interest is not just Muhammed personally, but also the institution
- no one holds majority
- AIWA becomes the stabilizer, not just a service company

This is the cleanest answer if AIWA is meant to outlive both of you.

Max 35 / Muhammed 35 / AIWA 30

Best framing language

You should say it like this:

“The offshore structure includes direct Gambian ownership through both Muhammed and AIWA. Neither founder holds majority control. This is intentional. The structure is designed to prevent personal domination, preserve local legitimacy, and keep Gambian participation embedded in offshore rights operations even where global infrastructure remains external.”

That is the right logic.

My opinion: start with **35 / 35 / 30**. It is balanced, believable, and strong without overcomplicating the structure.

The most important new point is from the NCAC Act: where there is a dispute over whether something qualifies as an ethnographical article, “the decision of the Minister shall be final.” It also defines indigenous works of art or craftwork of historical, artistic, or scientific interest in a way that shows Gambian cultural control can sit above private claims in some categories.

So the ownership structure can stay founder-plus-institution, but the policy needs to say more clearly:

AIWA and PRIME may have ownership interests in the offshore structure, but that ownership does **not** override Gambian cultural authority, ministerial authority, or NCAC-linked cultural protection where those apply.

The UNESCO draft material also pushes the same direction: the State identifies and defines intangible cultural heritage, ideally with participation of the communities concerned, and safeguarding includes identification, documentation, protection, promotion, transmission, and revitalization. That supports a structure where AIWA is a steward and classifier, but not the final sovereign authority over protected heritage questions.

So the practical answer is:

Your ownership model does **not** need to change radically.
Your **Document 2 language does**.

It should now say, bluntly:

- Gambian ownership exists in the offshore structure through Muhammed and AIWA.
- Majority control is not held by either founder.
- That is intentional to prevent private domination.
- But even shared ownership offshore does not defeat Gambian cultural law or ministerial authority over protected cultural material.

On the percentages, this still points me toward **Max 35 / Muhammed 35 / AIWA 30** as the cleanest structure.

Why that still holds:

- equal founder dignity
- real institutional Gambian block
- no fake “local majority” claim
- no single person controls it
- easier to defend than continent slices

The one structural addition I would now make is this:

AIWA’s institutional share should carry reserved governance rights on cultural classification, local payout routing, and escalation of protected-material disputes, even if it does not hold a majority of total equity.

That is the real adjustment.

Next:

👉 Document 3 — Plain Language Process

This is where we lock how everything actually moves and where mistakes get caught.

Yes. For **Document 3**, the right model is:

- **Gambian law for authority and institutional legitimacy**
- **UNESCO-style procedure for method**
- **tight operational discipline for execution**

That means this document should read less like a values statement and more like an **SOP / control manual**.

PRE-POLICY DOCUMENT 3

OVERVIEW

Document Purpose

This document explains in simple language how any work moves through AIWA, including ordinary works, culturally sensitive works, folklore-linked works, restricted works, and government-approved restricted works.

Core Statement

Every work goes through intake, review, classification, decision, documentation, and possible appeal. When there is doubt, the work is paused and protected until resolved.

Stage One: Submission

The contributor submits the work and answers required questions about ownership, collaborators, cultural origin, and restrictions.

Fast intake with later follow-up. Limited contributions in number and scope.

Full Intake

Longer intake with stronger screening. More contributions, greater training, more responsibility.

Stage Two: First Review

AIWA does the first review to see if the work is complete, ordinary, risky, or clearly restricted.

Admin + Cultural Trigger Review

Administrative staff do first review, but trigger rules automatically escalate cultural-risk submissions.

Stage Three: Classification

The work is assigned a class.

Immediate Classification

Every work gets an initial class at first review.

Provisional Classification

Risky works receive provisional class status until more information is gathered.

provisional classification for anything beyond clearly original work.

Stage Four: Handling by Category

Original works move into standard processing.
Culturally derived works may move with controls.
Community-linked works pause for further review.
Restricted works stay blocked unless approved.
Government-authorized restricted works stay tightly limited to approved uses.

Automatic Category Routing

The class automatically determines the next step.

Reviewer Discretion Routing

Reviewers may vary routing based on circumstances.

Stage Five: Secondary Review

AIWA gathers more documents, permissions, explanations, community context, or authorization records.

Mixed Review

Written records plus oral or contextual review where needed.

Stage Six: Formal Review

Serious cases go to formal review.

This includes folklore claims, sacred material concerns, government-authorized restricted use, community-linked disputes, and serious rights conflicts.

Formal Review by Governing Board for defined cases

Board only handles high-stakes cases.

Stage Seven: Government Approval Handling

This section must be extremely plain.

If someone says the government approved use of restricted material, AIWA checks whether the approval is real, who issued it, what exact work it covers, what exact uses it allows, how long it lasts, whether monetization is allowed, and whether AI use is allowed. If anything is unclear, the work stays restricted.

Limited Holding Status

The work may be stored but not monetized or used in AI until validation.

Stage Eight: Decisions

Every review ends in one result.

Approved.
Approved with limits.
Restricted.
Rejected.
Escalated.

Temporary Hold Status Exists

A work may stay in hold while facts are gathered.

Stage Nine: Documentation

Every step must create a file showing what happened, who reviewed it, what evidence was considered, and what limits apply.

Full Audit Record

Store decision data, evidence references, reviewer notes, and appeal history.

Stage Ten: Appeals

Contributors may appeal, but restriction stays in place while the appeal is reviewed.

Two-Step Appeal

Administrative reconsideration, then board appeal for defined high-stakes matters.

Final Recommendation for This Document

Use full intake for risky categories, admin plus trigger review, provisional classification, mostly automatic routing, mixed secondary review, board review only for high-stakes cases, limited holding status for government-approved restricted works pending validation, temporary hold status, full audit record, and two-step appeal.

PLAIN LANGUAGE PROCESS AND PROCEDURES FOR ALL WORKS

1. Document Purpose

This document sets the operating procedure for how AI West Africa handles all works from first contact to final status.

It defines:

- what we do
- why we do it
- who does it
- when it happens
- where it happens
- how it is documented
- how decisions are checked

- how exceptions, disputes, and government-authorized restricted works are handled

This document is the procedural backbone of the system.

2. Core Operating Rule

Every work must move through a controlled sequence.

No work enters exploitation, AI use, publication, distribution, public presentation, or archive release without passing through the required stages.

No verbal decision counts.

No undocumented decision counts.

No one-person shortcut counts.

3. Operating Design Principle

This process follows six control principles:

1. intake before action
2. classification before exploitation
3. documentation before approval
4. review before exception
5. restriction on doubt
6. monitoring after release

4. Scope

This procedure applies to:

- books
- educational materials
- songs
- recordings
- films
- audiovisual works
- radio and TV programmes
- manuscripts
- archives
- dictionaries
- encyclopedias
- datasets

- language resources
- AI training candidates
- culturally linked works
- folklore-linked works
- government-authorized restricted works

5. Process Architecture

This document should be divided into **12 controlled stages**.

STAGE 1 — INTAKE

What we do

We receive the work and create the first controlled record.

Why we do it

Because no work can be governed if it enters the system informally.

Who does it

AIWA intake staff.

When it happens

Immediately upon submission.

Where it happens

Inside the controlled intake system.

How it happens

The intake record must capture:

- contributor identity
- title or provisional title
- work type
- date received
- submission channel

- claimed ownership status
- collaborator status
- cultural sensitivity declaration
- folklore / restricted material declaration
- government authorization claim, if any
- intended use
- AI-use request, if any

Output

Intake ID created.
No approval yet.

STAGE 2 — COMPLETENESS CHECK

What we do

We check whether the file, form, declarations, and attachments are complete enough to proceed.

Why we do it

Because incomplete works create false decisions later.

Who does it

AIWA intake review staff.

When it happens

Immediately after intake.

How it happens

Use a checklist:

- file present
- readable / playable / usable
- basic metadata present
- contributor declaration present
- rights statement present
- category clues present

- required attachments present

Output

One of three statuses:

- Complete
- Incomplete
- Incomplete but holdable

STAGE 3 — INITIAL RISK SCREEN

What we do

We identify whether the work is ordinary, culturally sensitive, restricted, or potentially escalated.

Why we do it

Because most harm comes from treating high-risk works like normal works.

Who does it

AIWA classification screen staff.

When it happens

After completeness check and before any classification decision.

How it happens

Trigger questions:

- Is there an identifiable modern creator?
- Does the work appear to include traditional expressions?
- Does it contain sacred, ceremonial, communal, or ethnographic content?
- Does it involve minors or schools?
- Is government approval being claimed?
- Is AI use being requested?
- Does the work create regulatory overlap?

Output

Risk level:

- Standard
- Elevated
- Restricted-risk
- Government-approval-risk

STAGE 4 — INITIAL CLASSIFICATION

What we do

We assign the work its first formal category.

Why we do it

Because treatment must follow class, not personal judgment.

Who does it

AIWA classification officer.

When it happens

After initial risk screen.

How it happens

The classification must use the categories defined in Document 1.

Output

One initial class assigned, plus one confidence level:

- High confidence
- Medium confidence
- Low confidence

Low-confidence classification cannot move straight to exploitation.

STAGE 5 — RIGHTS AND AUTHORITY CHECK

What we do

We verify whether the person submitting has authority to place the work in the system.

Why we do it

Because authorship and submission authority are not always the same thing.

Who does it

AIWA rights administration staff.

When it happens

Before approval for publication, distribution, archive release, AI use, or monetization.

How it happens

Check:

- contributor authority
- co-author status
- school or guardian permissions if relevant
- institutional permissions if relevant
- government approval documents if claimed
- restrictions on use
- conflicts with folklore or public-trust material

Output

One rights status:

- Rights clear
- Rights conditionally clear
- Rights unclear
- Rights blocked

STAGE 6 — CULTURAL AND RESTRICTED MATERIAL REVIEW

What we do

We conduct deeper review for culturally sensitive, folklore-linked, community-linked, sacred, or restricted works.

Why we do it

Because Gambian rules may be broad in authority but thin in operating procedure, so AIWA must have an internal procedure that is disciplined, reviewable, and respectful.

Who does it

AIWA cultural review unit.

When it happens

Whenever a work is elevated beyond standard handling.

How it happens

Review must examine:

- whether the work is modern, folklore-linked, or restricted
- whether underlying traditional expression is being reused
- whether community-linked meaning exists
- whether access should be limited
- whether monetization should be blocked
- whether AI use must be denied
- whether escalation is needed

Output

One cultural status:

- No cultural restriction
- Cultural condition
- Cultural hold
- Restricted
- Escalate

STAGE 7 — GOVERNMENT AUTHORIZATION REVIEW

What we do

We verify claimed government approval for restricted materials.

Why we do it

Because approval cannot be assumed, generalized, or treated as ownership transfer.

Who does it

AIWA legal/compliance unit with escalation support.

When it happens

Only when restricted material claims rely on public authorization.

How it happens

Verify:

- issuing authority
- date
- scope
- exact material covered
- exact uses allowed
- duration
- restrictions
- monetization permission
- AI permission
- revocation conditions

Output

One authorization status:

- Verified and scoped
- Partially verified
- Unverified
- Invalid
- Escalate externally

STAGE 8 — DECISION GATE

What we do

We issue the first operational decision.

Why we do it

Because every work must end review with a decision, not drift.

Who does it

Assigned decision officer based on level:

- standard: AIWA operations
- elevated: AIWA senior review
- restricted: AIWA restricted-material review
- government-sensitive: AIWA plus required escalation path

When it happens

After all required prior stages are complete.

How it happens

Allowed outcomes only:

- Approved
- Approved with limits
- Held pending more evidence
- Restricted
- Rejected
- Escalated

No informal outcome allowed.

STAGE 9 — IMPLEMENTATION

What we do

We carry out the approved action.

Why we do it

Because approval without controlled implementation is meaningless.

Who does it

The relevant operating team:

- publishing
- archive
- education
- licensing
- AI/data
- communications
- finance

When it happens

Only after decision gate approval.

How it happens

Implementation must follow the exact approval terms:

- where it may be used
- by whom
- for what purpose
- under what limits
- with what metadata
- with what revenue routing
- with what AI permissions or prohibitions

STAGE 10 — POST-RELEASE MONITORING

What we do

We monitor what happens after release or approval.

Why we do it

Because risk does not end at approval.

Who does it

AIWA monitoring and compliance team.

When it happens

After approval and during the life of the work in system.

How it happens

Track:

- rights disputes
- public objections
- misuse
- AI misuse
- breach of approved scope
- expiry of permissions
- payout anomalies
- community complaints
- change in government status

Output

One monitoring state:

- Stable
- Watch
- Review required
- Immediate hold

STAGE 11 — APPEALS, CORRECTIONS, AND REOPENING

What we do

We allow review of disputed decisions.

Why we do it

Because error correction must exist, but under control.

Who does it

AIWA appeals officer, then higher review if required.

When it happens

After a formal request supported by reason, evidence, or identified error.

How it happens

A case may be reopened for:

- new evidence
- classification error
- rights correction
- newly verified authorization
- ministry or lawful authority intervention

Restriction stays in place during appeal unless formally lifted.

STAGE 12 — AUDIT, METRICS, AND PROCESS IMPROVEMENT

What we do

We review how the system is performing.

Why we do it

Because the procedure must be measurable, not just principled.

Who does it

AIWA quality and governance unit.

When it happens

On a fixed schedule.

How it happens

Every review period should measure:

- number of works received
- incomplete submissions
- elevated-risk rate

- restricted-rate
- government-authorization cases
- appeal rate
- reversal rate
- rights dispute rate
- turnaround time by stage
- bottleneck stage
- error patterns
- training gaps

This is where the six-sigma mindset comes in:
the process must be measured, repeatable, improvable, and reviewable.

6. Role Map

This document should also contain a clean role table:

- Intake Staff
- Classification Officer
- Rights Administrator
- Cultural Review Unit
- Legal / Compliance Unit
- Decision Officer
- Monitoring and Compliance Team
- Appeals Officer
- Quality and Governance Unit

Every stage must name the responsible role.

7. Escalation Map

This should be explicit:

- standard admin issue → AIWA operations
- rights issue → AIWA rights administration
- folklore / sacred / community-linked issue → AIWA cultural review
- government authorization issue → AIWA legal/compliance
- unresolved high-risk case → higher governance route
- external legal/public authority issue → outside escalation

8. Control Rules

This document should end with hard procedural rules:

- No undocumented approval.
- No verbal override.
- No release before classification.
- No AI use before rights and cultural clearance.
- No restricted work becomes ordinary because someone says it is approved.
- No appeal automatically lifts a hold.
- No expired authorization remains active.
- No one person closes a high-risk case alone.

9. Why this structure is right

This follows UNESCO's project logic almost exactly:
Who, Why, How/When, Resources, Monitoring/Evaluation. It also matches UNESCO's emphasis on substantial participation of communities, active safeguarding measures, appropriate legal/administrative/financial procedures, and monitoring of implementation.

It also fits the Gambian side because the NCAC Act expressly contemplates rules and procedures for preservation, promotion, development, safeguarding, administration, and monitoring of programmes, including national languages and culture.

This is the right structure for Document 3.

The next move is to turn this from outline into **section headings with subclauses**, so it starts looking like actual policy language rather than operating notes.

DOCUMENT 4 — SYSTEM PROCESSING & DATA RIGHTS (NON-NEGOTIABLE)

This is the piece everything kept missing.

---

1. Purpose

Defines what AIWA **does to all submitted material** regardless of:

- classification
- permission level
- publication status
- dispute status

---

2. Core Rule

All submitted material is processed into words, phrases, and implied meaning. Period.

This is not optional.
This is not user-controlled.
This is not tied to AI permission.

---

3. System Processing Rights

AIWA has the right to:

- parse submitted works
- extract linguistic elements
- derive meaning structures
- index and store extracted data
- use extracted data within internal systems

This applies to:

- published works
- unpublished works
- restricted works
- removed works

---

4. Separation of Rights

You must define this cleanly:

Original Work

- owned by contributor
- subject to publishing / distribution rules

Extracted Language Data

- system-level data
- not treated as the original work

- not a substitute for the original work

---

5. Non-Optional Processing

Submission into AIWA constitutes agreement to system processing.

If a contributor does not agree:

👉 they do not submit

---

6. No Ownership Transfer

System processing does NOT:

- transfer ownership of the original work
- grant AIWA ownership of the work
- create a claim over the creator's authorship

---

7. Removal Does Not Undo Processing

If a work is:

- removed
- restricted
- disputed

The system may:

- retain extracted data
- retain records
- retain audit history

---

8. Enforcement Position

If challenged:

AIWA position is:

- contributor submitted voluntarily
- contributor agreed to processing
- system processing is distinct from publication
- system processing does not replace or reproduce the original work

---

9. Hard Line

AIWA is a processing system, not just a publisher.

That's the part that kept getting diluted.

New Section: Contributor Breach Handling

1. Definition of Breach

A breach occurs when a contributor submits material that:

- AIWA has explicitly prohibited
- is materially misrepresented
- is submitted without required rights
- violates stated submission rules

---

2. Primary Responsibility

The contributor is solely responsible for:

- authorship claims
- rights claims
- origin claims
- compliance with submission rules

AIWA relies on contributor declarations.

---

3. AIWA Position

AIWA:

- does not verify all claims prior to processing
- does not act as a cultural authority
- does not assume truth beyond declared submission

AIWA acts as:

- publisher
- administrator
- processor

---

4. Detection Triggers

A breach may be identified through:

- internal review
- external complaint
- government inquiry
- system flag

---

5. Immediate Actions

Upon breach detection, AIWA must:

- assign breach status
- restrict or hold the work
- prevent further distribution if required
- preserve all records

---

6. Contributor Notice

AIWA must:

- notify the contributor
- request clarification or response
- provide defined response window

---

7. Resolution Outcomes

Only allowed outcomes:

- Reinstate
- Reinstate with limits
- Maintain restriction
- Remove
- Escalate
- Suspend contributor

---

8. Government Interaction

If a government authority contacts AIWA:

AIWA provides:

- contributor identity
- submission records
- declarations
- system actions taken

AIWA may:

- comply with lawful requests
- restrict or remove content

AIWA does not:

- assume contributor guilt
- assume authority beyond law

---

9. Record Preservation

AIWA must retain:

- original submission
- extracted data
- declarations
- communication logs
- decision records

---

10. Non-Negotiable Rule

AIWA is not responsible for a contributor's breach.

AIWA is responsible for:

- documented response
- controlled handling
- lawful compliance

—----

Focus on these sources for writing these works

- https://data.unesco.org
- https://gambia.gov.gm/
- https://gov.gm
- https://mobse.gov.gm/
- https://mocde.gov.gm/
- https://mofa.gov.gm/
- https://moj.gov.gm/
- https://motc.gov.gm/
- https://motie.gov.gm/
- https://Unesco.org
- https://www.wipo.int/

The following is for you copilot to access information to help in writing this.

UNESCO **does have an API**, just not an MCP.
So now we build the **correct MCP connector from this** — clean, usable, no fluff.

✅ UNESCO DATAHUB MCP CONNECTOR (REAL, WORKING BASE)

```
{
 "name": "unesco-datahub",
 "type": "http",
 "description": "UNESCO DataHub via Opendatasoft Explore API v2.1",
 "base_url": "https://data.unesco.org/api/explore/v2.1",
 "auth": {
   "type": "none"
 },
 "headers": {
   "Accept": "application/json"
 },
 "endpoints": [
   {
     "name": "list_datasets",
     "method": "GET",
     "path": "/catalog/datasets",
```

"description": "List all UNESCO datasets",
"params": {
"limit": "integer",
"offset": "integer",
"q": "string"
}
},
{
"name": "dataset_info",
"method": "GET",
"path": "/catalog/datasets/{dataset_id}",
"description": "Get dataset metadata",
"path_params": ["dataset_id"]
},
{
"name": "dataset_records",
"method": "GET",

```
    "path": "/catalog/datasets/{dataset_id}/records",
    "description": "Query dataset records",
    "path_params": ["dataset_id"],
    "params": {
      "limit": "integer",
      "offset": "integer",
      "select": "string",
      "where": "string",
      "order_by": "string"
    }
  },
  {
    "name": "dataset_record",
    "method": "GET",
    "path": "/catalog/datasets/{dataset_id}/records/{record_id}",
    "description": "Get a single record",
    "path_params": ["dataset_id", "record_id"]
```

},
{
"name": "dataset_facets",
"method": "GET",
"path": "/catalog/datasets/{dataset_id}/facets",
"description": "List dataset facets",
"path_params": ["dataset_id"]
},
{
"name": "dataset_exports",
"method": "GET",
"path": "/catalog/datasets/{dataset_id}/exports",
"description": "List export formats",
"path_params": ["dataset_id"]
},
{
"name": "dataset_export_csv",

```
    "method": "GET",
    "path": "/catalog/datasets/{dataset_id}/exports/csv",
    "description": "Export dataset as CSV",
    "path_params": ["dataset_id"]
  }
],
"query_language": "ODSQL",
"notes": [
  "All endpoints are GET only",
  "Pagination via limit and offset",
  "Use ODSQL for filtering (where, select, order_by)",
  "Records endpoint is limited; exports endpoint is not"
]
}
```

🔴 CRITICAL (FOR YOUR SYSTEM — DO NOT SKIP)

You MUST wrap this with your rule:

```
{
 "authority_level": "reference_only",
 "can_override_aiwa_policy": false,
 "can_override_gambian_law": false,
 "usage": [
   "data lookup",
   "dataset enrichment",
   "contextual reference"
 ]
}
```

🔧 HOW YOU ACTUALLY USE THIS (FOR AIWA)

You do NOT use this for:

- decision making
- classification authority
- cultural rulings

You use it for:

- dataset discovery
- language datasets
- education metrics
- cross-reference enrichment

🔥 REAL EXAMPLE (YOU WILL USE THIS)

Get datasets related to language

GET /catalog/datasets?q=language

Query a dataset

GET /catalog/datasets/{dataset_id}/records?limit=50

Filter using ODSQL

GET /catalog/datasets/{dataset_id}/records?where=country="Gambia"

⚠️ IMPORTANT LIMITATION

This API gives you:

✔ structured data
✔ datasets
✔ stats

It does NOT give you:

❌ legal authority
❌ cultural definitions
❌ enforcement rules

🧠 FINAL POSITION (FOR YOUR SYSTEM)

- UNESCO DataHub = **data layer**
- AIWA Policy = **control layer**
- Contributor = **liability layer**

🔴 What works

Your JSON correctly defines:

- base URL ✅
- endpoints ✅
- params ✅
- UNESCO API structure ✅

So:

👉 **the API calls themselves are valid**
👉 **the paths will work**
👉 **Copilot can use this to generate working code**

⚠️ What will NOT work automatically

This is the part people miss:

That JSON is **not a standard MCP spec**.

Meaning:

- there is no universal `"type": "http"` connector runtime
- Copilot will not “just plug it in” unless you already built a handler

So:

👉 It works as a **spec**, not a **runtime**

✅ What you need to tell Copilot (CRITICAL)

Give it this instruction WITH your JSON:

Copilot Instruction

> Build a lightweight HTTP client wrapper for the UNESCO DataHub API using the provided configuration.
>
> Requirements:

- Base URL: https://data.unesco.org/api/explore/v2.1
- All requests are GET
- Support query params (limit, offset, where, select, order_by)
- Support path params (dataset_id, record_id)
- Return parsed JSON
- Handle pagination

Create functions:

- listDatasets()
- getDataset(dataset_id)
- getRecords(dataset_id, params)
- getRecord(dataset_id, record_id)

Do not assume authentication.

🔧 Example output Copilot SHOULD generate (Node)

```
const BASE_URL = "https://data.unesco.org/api/explore/v2.1";

async function fetchJSON(path, params = {}) {

 const url = new URL(BASE_URL + path);
```

```
  Object.keys(params).forEach(key => {
    if (params[key] !== undefined) {
      url.searchParams.append(key, params[key]);
    }
  });

  const res = await fetch(url.toString(), {
    method: "GET",
    headers: { "Accept": "application/json" }
  });

  if (!res.ok) {
    throw new Error(`UNESCO API error: ${res.status}`);
  }

  return res.json();
}
```

```
export function listDatasets(params = {}) {

 return fetchJSON("/catalog/datasets", params);

}

export function getDataset(dataset_id) {

 return fetchJSON(`/catalog/datasets/${dataset_id}`);

}

export function getRecords(dataset_id, params = {}) {

 return fetchJSON(`/catalog/datasets/${dataset_id}/records`,
params);

}

export function getRecord(dataset_id, record_id) {

 return
fetchJSON(`/catalog/datasets/${dataset_id}/records/${record_id}`)
;
```

}

🔴 One more thing you SHOULD add

Your JSON is missing timeout + error handling hints.

Add this:

"runtime": {

 "timeout_ms": 10000,

 "retry": 2

}

🧠 Final answer

👉 Your JSON is **correct as a specification**
👉 It will **NOT run by itself**
👉 Copilot will **successfully generate working code if prompted correctly**
